Half-life and fraction remaining

The half-life for ^{32}P is 14.3 days. How much remains from a 0.1 g sample after 5 weeks?

Half-life and fraction remaining

The half-life for ^{32}P is 14.3 days. How much remains from a 0.1 g sample after 5 weeks?

Solution: convert 5 weeks to 35 days. The number of half lives is:

$$n = 35/14.3 = 2.45$$

Fraction remaining $= (1/2)^n = (1/2)^{2.45} = 0.18$

Therefore, 0.018 grams remain after 5 weeks.
